

# Image Processing II

## Histograms & Intensity transformations

# Histograms

Learning objectives

This lecture will cover the following topics:

- Generation of image histograms
- Optimization of image acquisition
- Intensity transformations used for image enhancement
  - Brightness and contrast adjustment
  - Histogram equalization
  - Histogram matching

# Histograms

## Generation of histograms

## Generation of image histograms in MATLAB

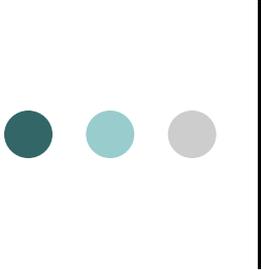

Syntax	Description
<b>MATLAB functions for generating histograms</b>	
<pre>[counts,edges] = histcounts(X,edges)</pre>	Sorts data into bins with the bin edges specified by the vector <code>edges</code> . Each bin includes the left edge, but does not include the right edge, except for the last bin which includes both edges.
<pre>counts = histc(X,binRange)</pre>	Counts the number of values in <code>X</code> that are within each specified bin range. The input <code>binRange</code> determines the endpoints for each bin. The output <code>counts</code> contains the number of elements from <code>X</code> in each bin. Note: Since <code>histc</code> has limited overall capabilities, its use in new code is discouraged.
<b>Image processing toolbox functions</b>	
<pre>[counts,binLocations]= imhist(Img)</pre>	Calculates the histogram for the grayscale image <code>Img</code> . The <code>imhist</code> function returns the histogram counts in <code>counts</code> and the bin locations in <code>binLocations</code> . The number of bins in the histogram is determined by the image class.
	See MATLAB help page for further information

# Histograms

## Plotting histograms in MATLAB

Syntax	Description	Example
<b>MATLAB functions for plotting bar graphs</b>		
<code>h = bar(X,Y)</code>	Draws bars with the height $Y$ at the locations specified by $X$ . <code>h.FaceColor = "black"</code> or <code>set(h,"FaceColor","black")</code> chooses black as color for the bars.	
<code>h = stem(X,Y)</code>	Plots the data sequence $Y$ as stems that extend from the baseline. The data values are indicated by circles terminating each stem. Other symbols can be chosen by setting the property <code>Marker</code> . The color is determined by the property <code>"Color"</code> . Also style of the stems and of the baseline can be changed.	
<code>h = stairs(X,Y)</code>	Draws a stairstep graph of the elements in $Y$ at the locations specified by $X$ .	
	See MATLAB help page for further information	

# Histograms

## Generating and plotting image histograms in MATLAB

Syntax	Description
<b>MATLAB functions for generating and plotting histograms</b>	
<code>h = histogram(X,edges)</code>	Sorts <code>X</code> into bins with the bin edges specified by the vector <code>edges</code> and creates a histogram plot. Each bin includes the left edge, but does not include the right edge, except for the last bin which includes both edges.
<code>hist(X,binRange)</code>	Counts the number of values in <code>X</code> that are within each specified bin range. The input <code>binRange</code> determines the endpoints for each bin. Note: Using <code>hist</code> in new code is not recommended.
<b>Image processing toolbox functions</b>	
<code>imhist(Img)</code>	<code>imhist</code> without output parameters calculates and plots the histogram for the grayscale image. If the input image is an indexed image, then the histogram shows the distribution of the pixel values above a colorbar of the colormap.
	See MATLAB help page for further information

# Optimizing image acquisition

Perceived image quality of photographs

$t = 20 \text{ ms}$

$t = 125 \text{ ms}$

$t = 250 \text{ ms}$

# Optimizing image acquisition

Using histograms to assess the image quality

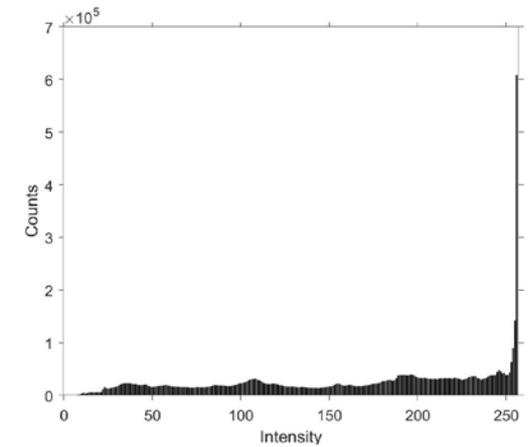

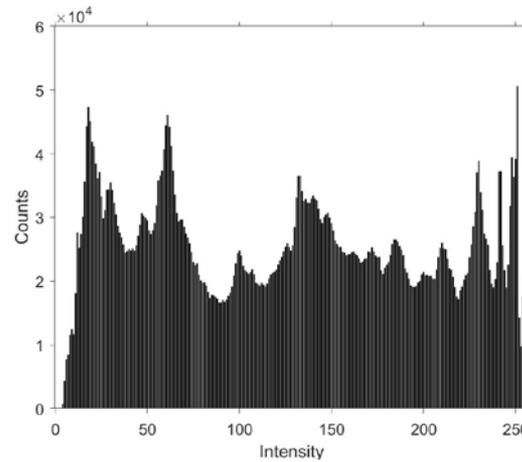

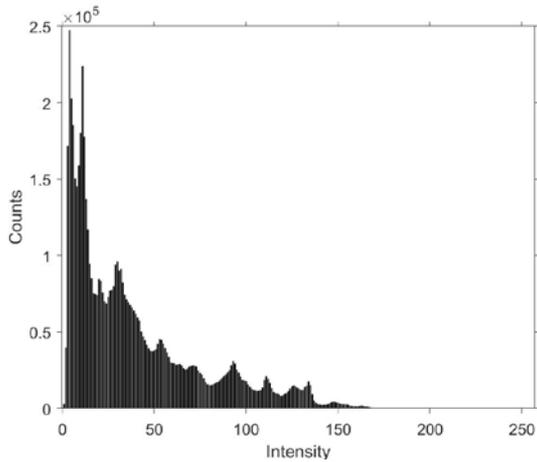

$t = 20 \text{ ms}$

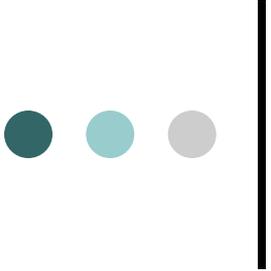

$t = 125 \text{ ms}$

$t = 250 \text{ ms}$

# Optimizing image acquisition

Factors affecting the brightness of photographs

Factors affecting the brightness of photographs:

- Exposure time
- ISO value
- Aperture size
- Illumination intensity

# Optimizing image acquisition

Factors affecting the brightness of a photograph:  
The ISO value

# Optimizing image acquisition

Factors affecting the brightness of a photograph:  
The aperture size

$f/1.4$

$f/2.0$

$f/2.8$

$f/4.0$

$f/5.6$

$f/8.0$

# Optimizing image acquisition

Effect of the aperture:  $F = 1/4$

# Optimizing image acquisition

Effect of the aperture:  $F = 1/5.6$

# Optimizing image acquisition

Effect of the aperture:  $F = 1/8$

# Optimizing image acquisition

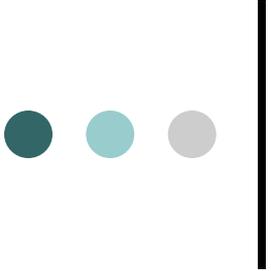

Effect of the aperture:  $F = 1/16$

# Optimizing image acquisition

Effect of the aperture:  $F = 1/32$

# Optimizing image acquisition

Factors affecting the brightness of photographs

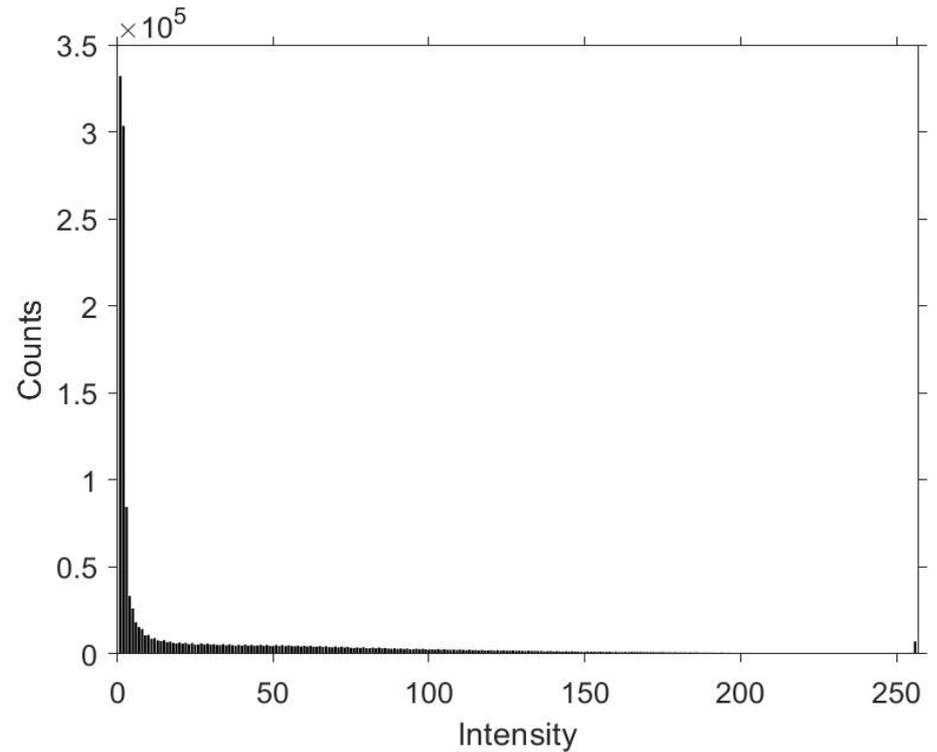

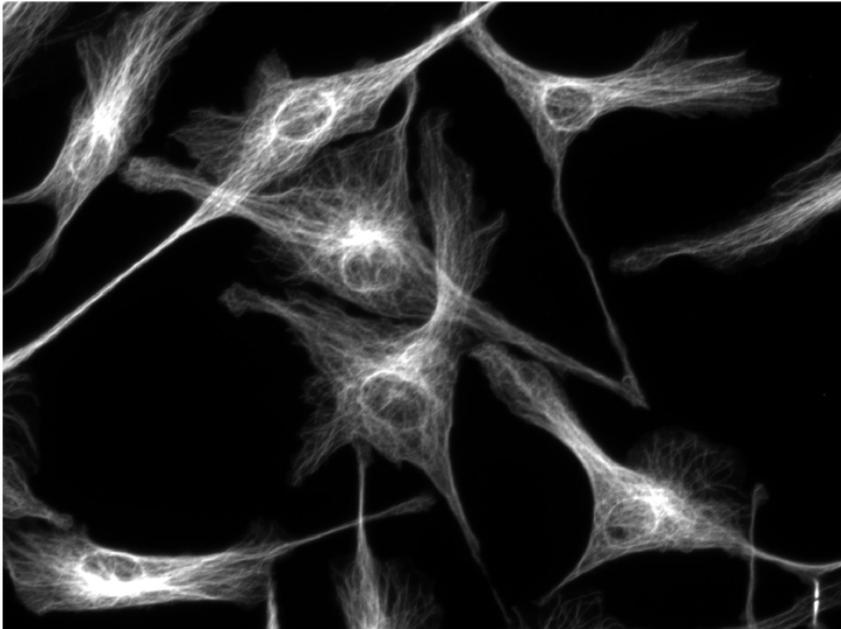

Factors affecting the brightness of photographs:

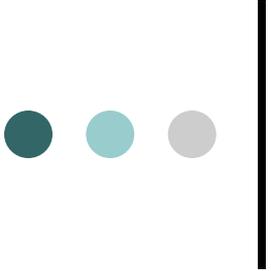

- Exposure time
- ISO value
- Aperture size
- Illumination intensity

# Optimizing image acquisition

## Histograms of microscopy images

# Optimizing image acquisition

Factors affecting the brightness of microscopy images

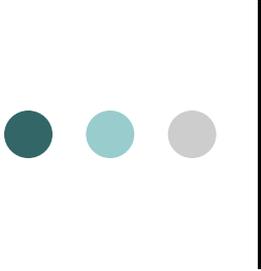

Factors affecting the intensity of an epifluorescence micrograph:

- Illumination intensity
- Acquisition time
- Gain of the camera
- Digital gain

Factors affecting the intensity of a confocal laser scanning micrograph

- Illumination intensity, i.e. laser intensity
- Pixel dwell time, i.e. scan speed
- Photomultiplier gain
- Digital gain

# Intensity transformations

## Definition

General form of intensity transformation functions:

$$g(x, y) = T(f(x, y))$$

where  $f(x, y)$  is the input image,

$g(x, y)$  is the output image,

$T$  is an operator on  $f$  defined over a specified neighborhood of point  $(x, y)$

Special form of intensity transformation for histogram operations:

$$s = T(r)$$

where  $r$  denotes the intensity in point  $(x, y)$  of the input image,

$s$  denotes the intensity in the same point  $(x, y)$  of the output image,

$T$  is an operator on  $f$  acting only on point  $(x, y)$

# Intensity transformations

## Definition

Intensity transformation for histogram operations:

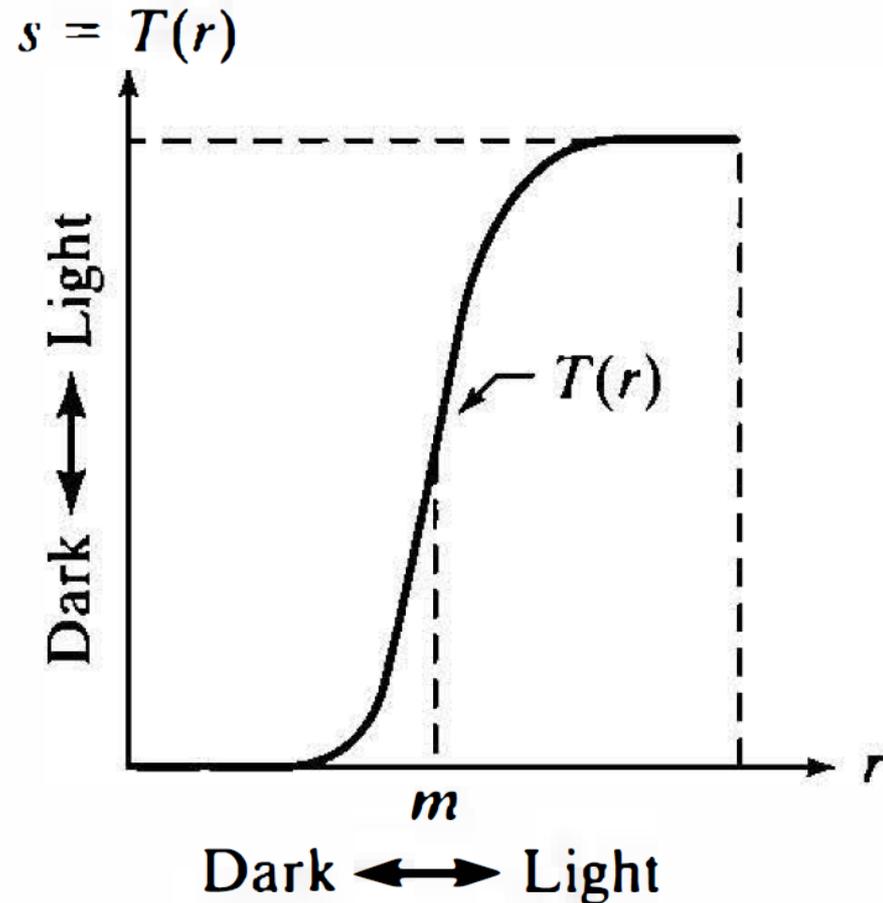

$$s = T(r)$$

where

$r$  denotes the intensity in point  $(x,y)$  of the input image,

$s$  denotes the intensity in the same point  $(x,y)$  of the output image,

$T$  is an operator on  $f$  acting only on point  $(x, y)$

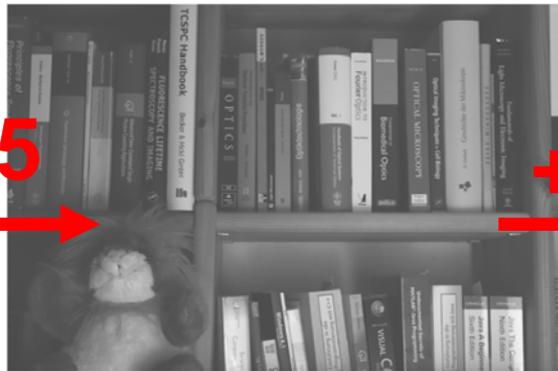

# Adjusting brightness & contrast

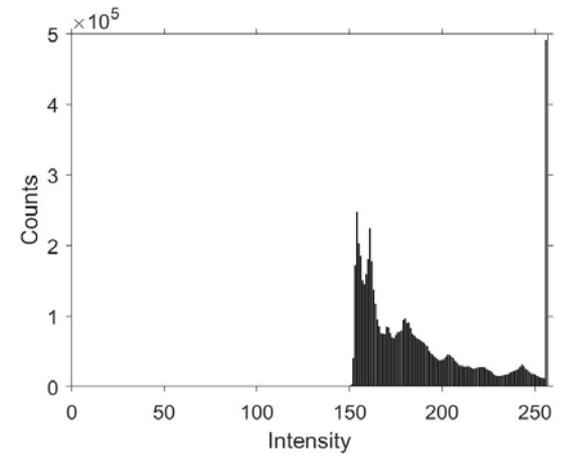

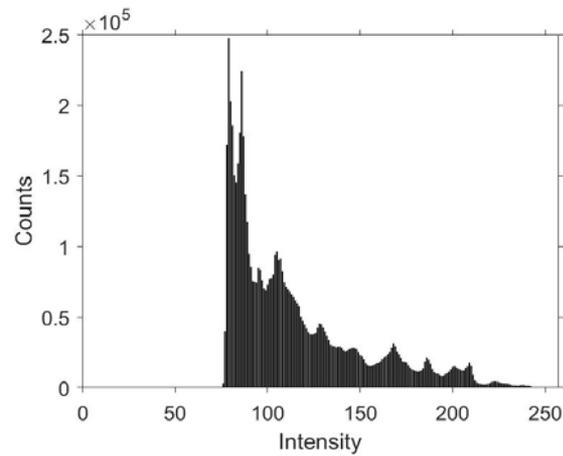

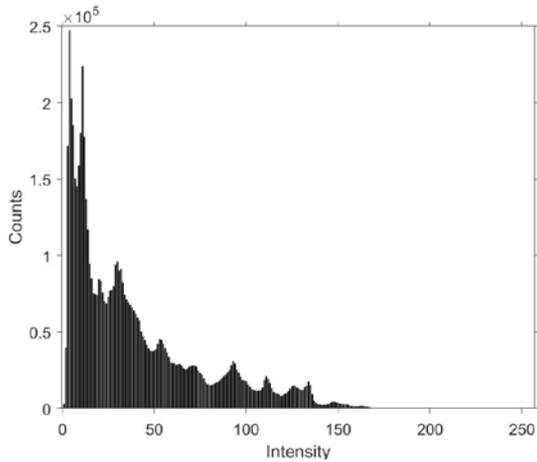

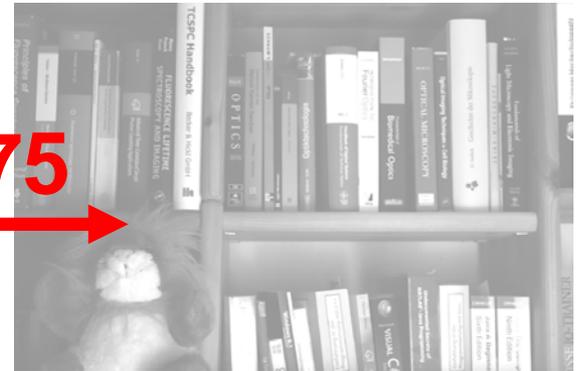

## Increasing the brightness

# Adjusting brightness & contrast

## Increasing the contrast (= gain)

# Adjusting brightness & contrast

## Contrast stretching

General scaling transformation to map gray level values  $I_f$  of the original image  $f$  to the transformed image  $g$ :

$$I_g = (I_f - I_{f,min}) \frac{(I_{g,max} - I_{g,min})}{(I_{f,max} - I_{f,min})} + I_{g,min}$$

where  $I_f$  gray level value in the original image  $f$   
 $I_{f,min}, I_{f,max}$  range of interest  
 $I_g$  mapped gray level value in the transformed image  $g$   
 $I_{g,min}, I_{g,max}$  range to which the intensities are mapped

In MATLAB contrast stretching can be achieved with `imadjust`:

```
ImgOut = imadjust(ImgIn, [lowIn, highIn], [lowOut, highOut])
```

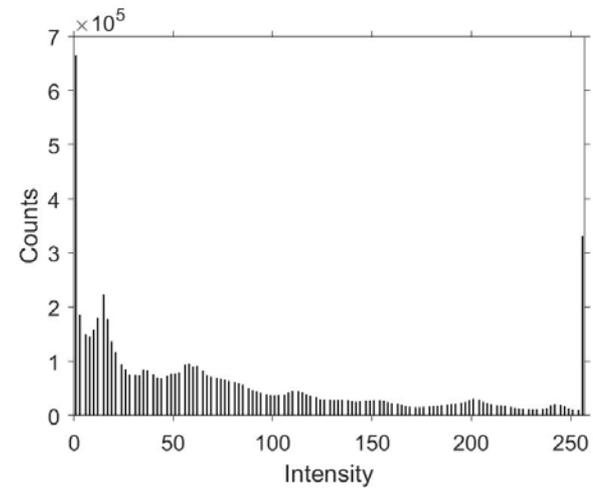

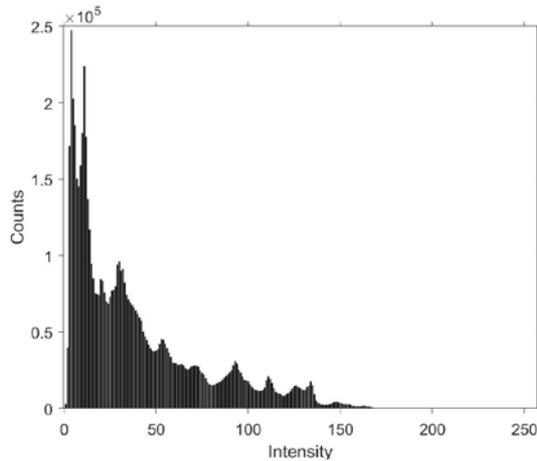

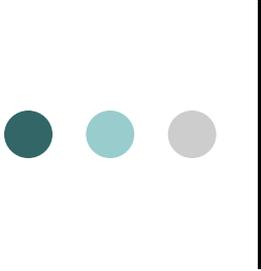

# Adjusting brightness & contrast

## Contrast stretching

contrast stretching

# Adjusting brightness & contrast

## Power law (gamma) transformations

General scaling transformation to map gray level values  $I_f$  of the original image  $f$  to the transformed image  $g$ :

$$I_g = (I_{g,max} - I_{g,min}) \left( \frac{I_f - I_{f,min}}{I_{f,max} - I_{f,min}} \right)^\gamma + I_{g,min}$$

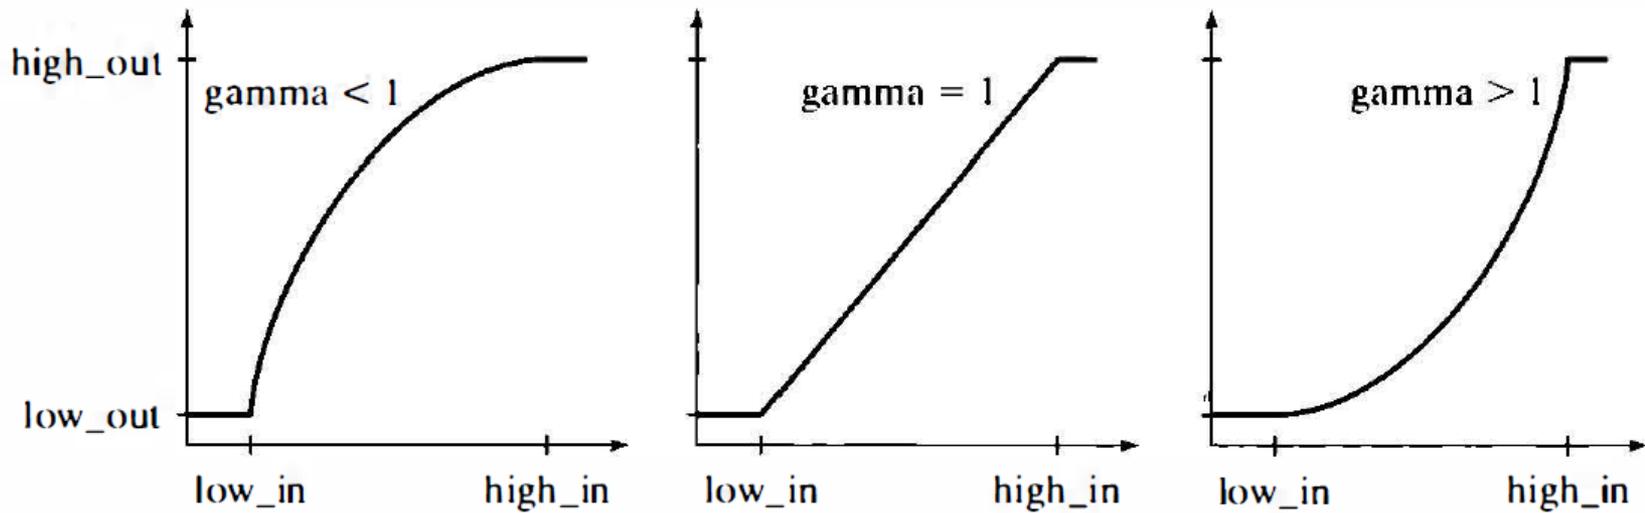

where  $I_f$  gray level value in the original image  $f$   
 $I_{f,min}, I_{f,max}$  range of interest  
 $I_g$  mapped gray level value in the transformed image  $g$   
 $I_{g,min}, I_{g,max}$  range to which the intensities are mapped  
 $\gamma$  adjustable exponential factor ( $\gamma > 0$ )

# Adjusting brightness & contrast

## Power law (gamma) transformations

gamma specifies the shape of the curve that maps the intensity values :

In MATLAB also power law transformations can be done with `imadjust`:

```
ImgOut = imadjust(ImgIn,[lowIn,highIn],[lowOut,highOut],gamma)
```

# Histograms

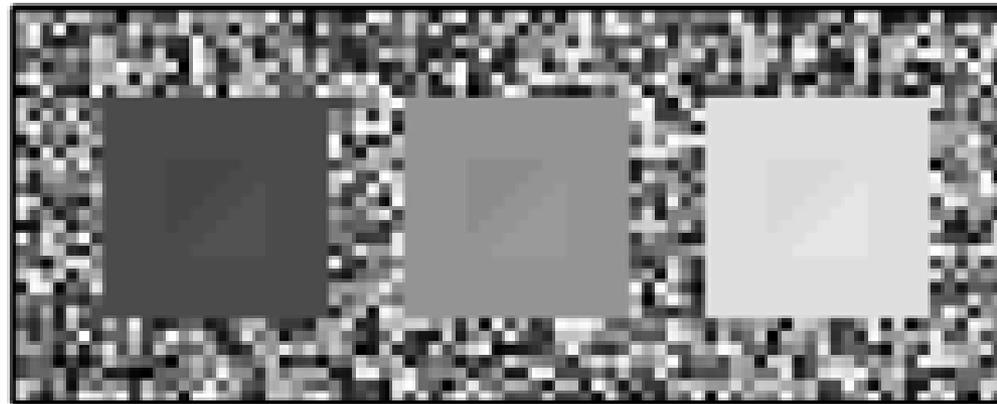

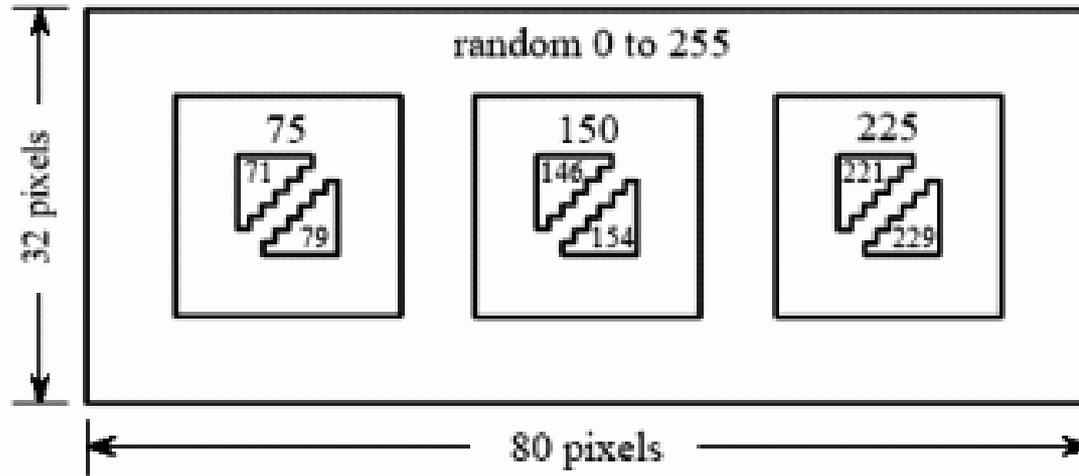

## Contrast stretching in MATLAB

Syntax	Description
<pre>ImgOut = imadjust(ImgIn)</pre>	Maps the intensity values in the input image <code>ImgIn</code> to new values in the output <code>ImgOut</code> . By default, <code>imadjust</code> saturates the bottom 1% and the top 1% of all pixel values.
<pre>ImgOut = imadjust(ImgIn, [lowIn,highIn], [lowOut,highOut])</pre>	Maps intensity values in <code>ImgIn</code> to new values in <code>ImgOut</code> such that values between <code>lowIn</code> and <code>highIn</code> map to values between <code>lowOut</code> and <code>highOut</code> . Values below <code>lowIn</code> and above <code>highIn</code> are clipped. This means, values below <code>lowIn</code> map to <code>lowOut</code> , and those above <code>highIn</code> map to <code>highOut</code> . Note: All limits are specified as values between 0 and 1, independently of the class of <code>ImgIn</code> .
<pre>ImgOut = imadjust(ImgIn, [lowIn,highIn], [lowOut,highOut],gamma)</pre>	Maps intensity values in <code>ImgIn</code> to new values in <code>ImgOut</code> , where <code>gamma</code> specifies the shape of the curve describing the relationship between the values in <code>ImgIn</code> and <code>ImgOut</code> .
<pre>LowHigh = stretchlim(Img,Tol)</pre>	Computes the lower and upper limits that can be used for contrast stretching. <code>Tol</code> specifies the percentage of pixels that are allowed to saturate at the bottom and at the top. The default is 1%. Limits are returned in <code>LowHigh</code> .

# Histogram equalization & matching

## Histogram equalization & matching in MATLAB

Syntax	Description
<code>ImgOut = histeq(ImgIn)</code>	transforms the grayscale image <code>ImgIn</code> to a grayscale image with <code>ImgOut</code> with the same number of discrete gray levels. A roughly equal number of pixels is mapped to each of the levels in <code>ImgOut</code> , so that the histogram of <code>ImgOut</code> is approximately flat.
<code>ImgOut = histeq(ImgIn,n)</code>	transforms the grayscale image <code>ImgIn</code> to a grayscale image with <code>ImgOut</code> with <code>n</code> discrete gray levels. A roughly equal number of pixels is mapped to each of the levels in <code>ImgOut</code> , so that the histogram of <code>ImgOut</code> is approximately flat. The histogram of <code>ImgOut</code> is flatter when <code>n</code> is much smaller than the number of discrete levels in <code>ImgIn</code> .
<code>ImgOut = histeq(ImgIn,HistIn)</code>	transforms the grayscale image <code>ImgIn</code> so that the histogram of the output grayscale image <code>ImgOut</code> matches approximately the target histogram <code>HistIn</code> .
<code>[ImgOut,T] = histeq(ImgIn)</code>	returns the transformation function <code>T</code> that maps gray levels in the image <code>ImgIn</code> to gray levels in <code>ImgOut</code> .
	See MATLAB help page for further information
