

Image Processing I – Exercises Week #2

Notes:

Try to solve the following questions (except for Exercise 2a/b) without the help of a computer. Enter your name, your student ID and your answers in this document and submit it as a Microsoft Word doc or pdf file to the following e-mail address:

image.processing.jena@gmail.com.

Deadline for the submission is: Tuesday, November 17th, 2020, 8.00 a.m. (CET).

Name:

Student-ID:

Exercise 1: Conversion of decimal, binary, octal and hexadecimal numbers

a) Convert the following decimal numbers into the binary, octal and hexadecimal system:

| Decimal | Binary | Octal | Hexadecimal |
|---------|----------------|-------|-------------|
| 10 | 0000 1010 | 12 | A |
| 20 | 0001 0100 | 24 | 14 |
| 30 | 0001 1110 | 36 | 1E |
| 40 | 0010 1000 | 50 | 28 |
| 127 | 0111 1111 | 177 | 7F |
| 256 | 0001 0000 0000 | 400 | 100 |
| 1984 | 0111 1100 0000 | 3700 | 7C0 |
| 2020 | 0111 1110 0100 | 3744 | 7E4 |

b) Convert the following (unsigned) binary numbers into the decimal, octal and hexadecimal system:

| Binary | Decimal | Octal | Hexadecimal |
|-----------|---------|-------|-------------|
| 0000 0010 | 2 | 2 | 2 |
| 0000 0100 | 4 | 4 | 4 |
| 0000 1100 | 12 | 14 | C |
| 0001 0000 | 16 | 20 | 10 |
| 0001 1000 | 24 | 30 | 18 |
| 0011 1000 | 56 | 70 | 38 |
| 0111 1111 | 127 | 177 | 7F |
| 1000 0000 | 128 | 200 | 80 |
| 1010 1010 | 170 | 252 | AA |
| 1111 1111 | 255 | 377 | FF |

c) Convert the following **signed** binary numbers into the decimal system assuming that negative numbers are represented by the two's complement

| Binary (2's compl) | Decimal |
|--------------------|---------|
| 0000 0010 | 2 |
| 0000 0100 | 4 |
| 1000 0000 | -128 |
| 1010 1010 | -86 |
| 1111 1111 | -1 |

d) Fill the gaps in the following text by converting the binary and decimal numbers into the hexadecimal system:

Hi DAD (3501),

that's so BAD (1011 1010 1101). I am so tired, I am almost

DEAD (57005). I need to go to BED (1011 1110 1101) right now.

- e) Most people can only count to 10 on their fingers. You, however, can now do better. If you regard each finger as one binary bit, with finger extended as 1 and finger touching the palm as 0, how high can you count using both hands?

All ten fingers extended $1111111111 \rightarrow 2^{10} - 1 = 1023$

Exercise 2: Data classes

- a) Which is the lowest and highest value that can be stored in a Python float variable? How can you determine these values?

Python floats are double precision floating point numbers. The maximum value is (see slide 50):

$$OFL = (1 - 2^{-(p+1)}) * 2^{(emax + 1)}$$

With $p=52$, $emax = 1023$ (see slide 49) we have: $OFL = 1.7976931348623157e+308$

Python code:

```
>>> import sys
>>> print(sys.float_info.max)
```

- b) Which is the smallest positive value that can be stored in a variable of type of float? How can you determine this value?

$$UFL = 2^{emin}$$

With $emin = -1022$ we have: $UFL = 2.2250738585072014e-308$

Python code:

```
>>> import sys
>>> print(sys.float_info.min)
```

Exercise 3: Arithmetic operations

- a) Perform the following additions on (unsigned) binary numbers.

$$\begin{array}{r}
 00011101 \\
 + 01101111 \\
 \hline
 Carry 111111 \\
 Sum 10001100
 \end{array}$$

$$\begin{array}{r}
 01000001 \\
 + 11111111 \\
 \hline
 Carry 11111111 \\
 Sum 101000000
 \end{array}$$

- b) Perform the following additions on signed binary numbers. (Note that in the two's complement notation the most significant bit represents the number -128. Negative numbers in the two's complement notation can be added like positive numbers and yield the correct result, when the overflow is ignored.)

$$\begin{array}{r}
 00011101 \\
 + 01101111 \\
 \hline
 Carry 11111110 \\
 Sum 10001100
 \end{array}$$

$$\begin{array}{r}
 \\
 + \\
 \hline
 Carry 11111110 \\
 Sum \cancel{+}01000000
 \end{array}$$

- c) Perform the following additions on hexadecimal numbers.

$$\begin{array}{r}
 \\
 + ABCD \\
 \hline
 Carry 0110 \\
 Sum BE01
 \end{array}$$

$$\begin{array}{r}
 \\
 + 1111 \\
 \hline
 Carry 11110 \\
 Sum 11110
 \end{array}$$

- d) A binary number can be subtracted by adding its two's complement, which is obtained by inverting all bits and adding 1. For example, using 1 byte (ie. 8 bits) the decimal number 6 is represented by 0000 0110. To find the signed binary number representing the decimal value -6, we first invert the bits: 1111 1001 (one's complement) and then add 1: 111 1010 (two's complement).

Now, subtract B = 0101 0101 and C = 0111 0101 from A = 0111 0000 by adding the two's complement of B and C to A.

1's complements: B → 1010 1010, C → 1000 1010

2's complements: B → 1010 1011, C → 1000 1011

$$\begin{array}{r}
 A 01110000 \\
 -B 10101011 \\
 \hline
 Carry 11000000 \\
 Sum 100011011
 \end{array}$$

$$\begin{array}{r}
 A 01110000 \\
 -C 10001011 \\
 \hline
 Carry 00000000 \\
 Sum 11111011
 \end{array}$$
